Statistical Methods in Experimental Physics

By D. DRIJARD, *CERN*, W. T. EADIE, *Fuel and Energy Statistics Division, Department of Trade and Industry, London; formerly Statistician, CERN*, F. E. JAMES, *CERN*, M. G. W. ROOS, *University of Helsinki* and *CERN*, and B. SADOULET, *CERN*.

1971. 308 pages. Dfl. 50.00 (ca. $14.75) ISBN 0-7204-0239-5

This is the first book to treat statistical problems at the advanced level encountered in experimental high-energy physics.
The book presents a brief summary of probability with emphasis on useful distributions, an advanced course in statistics, comprising estimation of parameters, tests of hypotheses, and goodness-of-fit tests and an introduction to information theory, decision theory and Bayesian statistics. Various concepts of optimality are stressed to enable the reader to optimize his choice of method in the face of a given problem.
The criteria of optimality range from classical statistical merits, such as minimum variance and minimum loss of information, to economy of computer time, and physicist's time.

Contents:
Basic concepts in probability.
Convergence and the law of large numbers.
Probability distributions.
Information.
Decision theory.
Theory of estimators.
Point estimation in practice.
Interval estimation.
Tests of hypotheses.
Goodness-of-fit tests.
